

## Arguments for the "BENCHMARK 750"

- Operating height only 750 mm, This renders pits and platforms superfluous even if using sliding devices with spacer plates.
- The strip intake height amounts to 2.150 mm only. Thus the strip feeding can be directly done from the floor, The 2-step stairs used so far are no longer required.
- The accessibility to the runner deck is decisively improved owing to the machine height reduced by about 400 mm.
- The maximum opening stroke is now around 830 mm instead of 600 mm.
- The transfer of the clamping force was further optimized due to the large diameter clamping cylinder.
- Increased ease of servicing, (Examples: Exchange of seals on the pressure block can be realized with the clamping system moved out / No maintenance of the mold height adjustment.)
- Automatic mold height adjustment, data stored together with the mold data.
- The total machine height was reduced by approx. 500 mm.
